

What are we gonna Master Today?

Str Data Type

⇒ In python, String (str) is a sequence of character

★ Python does not have a char data type, unlike C/C++ or Java

Single (' ') or double (" ") quotes can be used to define / represent a string.

eg. a = "mayank" b = 'python'

For multi-line string, triple quotes (" " " ") are used

```
C = " This is  
a multi  
line string "
```

How does Python store Strings?

Python uses UNICODE number system.

Unlike C which uses ASCII.

★ UNICODE is a number system which supports much wider range of character compared to ASCII. It also supports multiple language.
